manage your IT & business

Connecting Two Worlds: IT Department & Business

Easily share the knowledge on hardware and software management, user activity tracking, and data security, with non-IT managers.

Three Minutes to Learn The Intuitive Interface

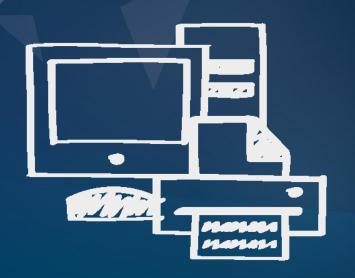

3

Quick implementation, user-friendly interface and flexibility – immediate improvement of your IT Asset Management in 5 main areas:

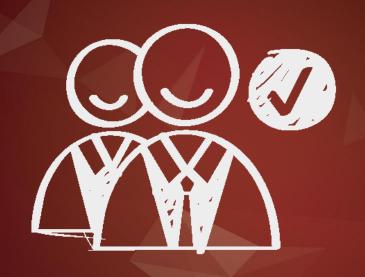

Hardware & Software Management

Uplook & statlook are professional systems for software legality control (license compliance) which offer the functionality of license management and professional remote audits of software, media files or fonts.

Hardware asset management (which may also involve any other equipment) has never been so easy allowing the reporting of all your fixed assets as well as well-planned purchases. Automated remote hardware asset management system renders the task highly timesaving.

User Activity Monitoring

We compile multiple detailed information concerning the work of users, such as applications used, Web sites visited, work breaks, documents printed or operations on external hard drives, pen drives, memory cards, etc.

The data from longer time spans is presented in the form of clear reports and enables highly accurate evaluation of risks and bottlenecks in our organization.

Data Leakage Prevention

Gathering data on the use of external data storage devices, monitoring users' activity and performing scheduled audits makes the infrastructure safer.

Still, if necessary, we can block some applications, www sites or the use of removable media. Using statlook DLP features IT personnel can efficiently increase the security of data and infrastructure.

Remote PC Management

Auditing and asset management is carried out remotely on all computers connected to the corporate network, which guarantees substantial timesaving!

Moreover, all computers can be managed remotely, without the need to change location, which is particularly beneficial in large buildings or departments in multiple locations. Pure comfort and saving your precious time!

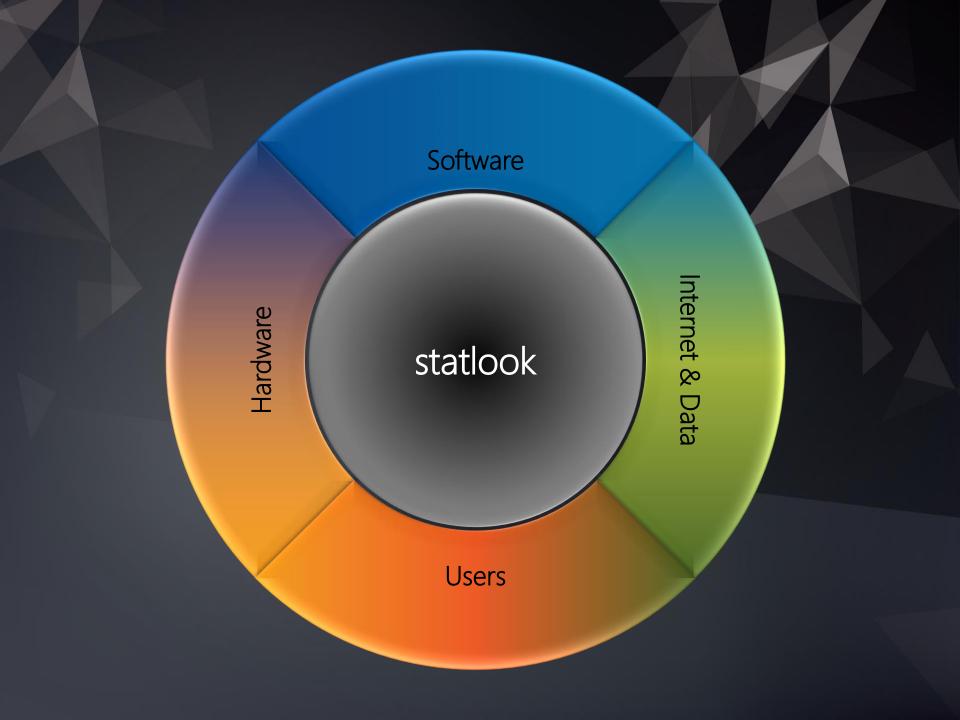

Helpdesk Online

Online and desktop support allows you to easily manage your daily duties and user requests as well as resolve problems and assign tickets to others.

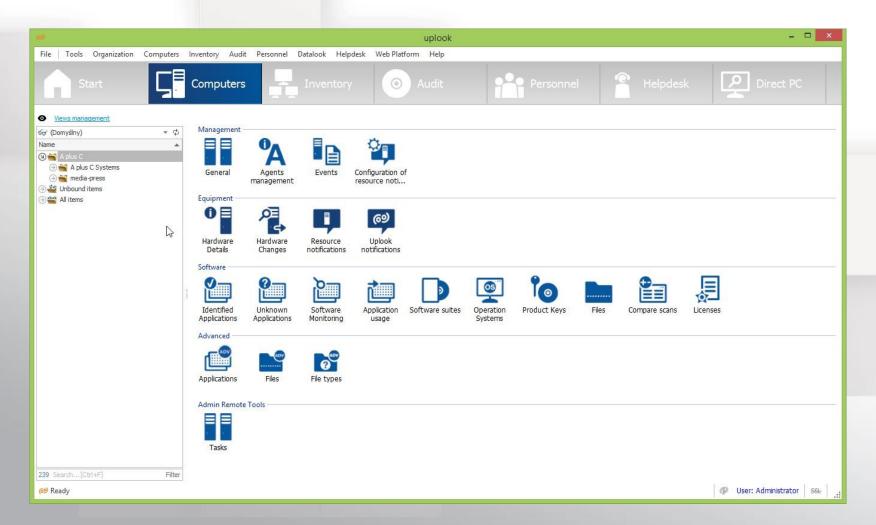

Use any device with Internet browser to help your users. Let the users use personalized knowledge base and check the current status of their tickets both online and with a desktop Assistant app.
